**BUT WHY???**

## SIMILAR LINUX DISTRO

- tsurugi
- buscador
- csi linux
- tracelabs' osint vm

Our GOAL is to have something more customizable

- Open source
- use configuration management (SaltStack)

**SALTSTACK??**

- configuration management & orchestration tool
- used in DevOps, similar to Ansible

**BUT WHY SALTSTACK?**

- idempotency
- personal preference, while learning devops stuff
- inspired by REMNUX
- more structured and easier to maintain/troubleshoot
